

Personnel Protection - Insulation - CUI Protection

An Australian based explosive, propellant and ammunitions manufacturing plant sought a solution which would provide a long lasting thermal insulator that would protect against corrosion maximizing the longevity of their holding tanks reducing maintenance and repairs. Located in an environmentally sensitive area the product was required to adhere to the strict regulations within this industrial zone

As an environmentally friendly solution, **Mascoat Industrial** Insulation is water based, single component product free of contaminants, flammable liquids or VOC's. The product was perfectly suited for application and was chosen to be applied to the large heating holding tanks and adjoining pipe work to provide, insulation, personnel protection, and energy retention with the added benefit of being able to protect against corrosion to maximize the life expectancy of the tanks. As a result the tanks were specified for application and applied with **Mascoat Industrial** to meet the customer's requirements of Energy Retention and personnel protection complying with industry zoning specifications.

Mascoat Industrial Coating is also classed as a "Fire Retardant Type Material" as characterized by Lloyds register making it ideal for this particular application within the explosives and propellant plant.
